

Tweestapsverificatie

Om je account op je Plesk server te beveiligen, raden we zeer sterk het gebruik van tweestapsverificatie aan. Dit configureer je via 'Google Authenticator'. Anders dan de naam doet vermoeden, werkt deze tweestapsverificatie niet enkel met de app 'Google Authenticator', maar met iedere TOTP-applicatie zoals Microsoft Authenticator, Twilio Authy, Bitwarden Authenticator, enz.

Tweestapsverificatie moet per account ingesteld worden. Heb je collega's die onder hun eigen account inloggen? Adviseer hen om tweestapsverificatie ook in hun account in te stellen. Laat je klanten inloggen op hun eigen Plesk customer account? Adviseer ook hen om tweestapsverificatie voor hun Plesk account te configureren.

The screenshot shows the Plesk control panel interface for configuring Google Authenticator. On the left is a dark sidebar with navigation items: Home, Hosting Services, Customers, Domains, Subscriptions, Service Plans, Tools & Utilities, WordPress, Laravel, Links to Additional Services, Google Authenticator (selected), My Profile, Profile, Change Password, and Interface Preferences. The main content area has a search bar at the top and a breadcrumb trail: Home > Extensions > Google Authenticator. Below the title, there is a checked checkbox for 'Enable Multi-factor Authentication'. A QR code is displayed with the instruction 'Scan this with the Google Authenticator App'. Below the QR code is a link: 'Could not scan the barcode?'. There are three input fields: 'Verification code *' (empty), 'Remember device in days *' (containing '30'), and a checkbox for 'Enable "Remember Device" functionality'. Below the checkbox is another checkbox: 'Pre-select "Remember Device" checkbox'. At the bottom left, there is a note: '* Required fields'. At the bottom right, there are two buttons: 'OK' (blue) and 'Cancel' (grey). A warning message is partially visible: 'The "Remember Device" functionality will cause your browser to remember will enforce a new authentication process. You should use this feature on'.
